

A Few Open Problems in Neural Theorem Proving

(in Lean)

Sean Welleck

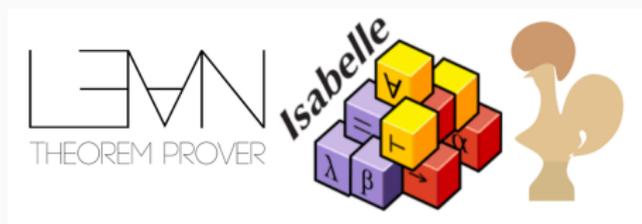

September 5, 2024

Carnegie Mellon University

Neural theorem proving

Use neural networks to:

- Generate proofs in an interactive proof assistant

Rapid progress in methods based on language models:

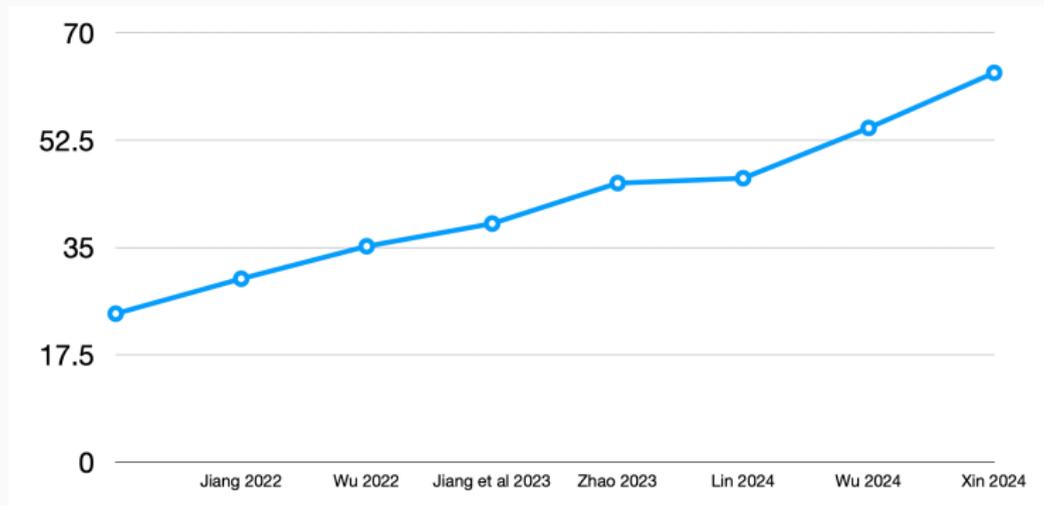

Figure 1: miniF2F benchmark performance, 2022-2024

Neural theorem proving | Rapid progress

```
theorem imo_1960_p2 (x : ℝ) (h₀ : 0 ≤ 1 + 2 * x) (h₁ : (1 - Real.sqrt (1 + 2 *
  x)) ^ 2 ≠ 0)
  (h₂ : 4 * x ^ 2 / (1 - Real.sqrt (1 + 2 * x)) ^ 2 < 2 * x + 9) : -(1 / 2)
  ≤ x ∧ x < 45 / 8 := by
  norm_num at h₀ h₁ h₂
  have h₃ : 0 ≤ 1 + 2 * x := by linarith
  have h₄ : 0 < 1 + Real.sqrt (1 + 2 * x) := by
    nlinarith [Real.sqrt_nonneg (1 + 2 * x)]
  have h₅ : 4 * x ^ 2 / (1 - Real.sqrt (1 + 2 * x)) ^ 2 < 2 * x + 9 := by
    linarith
  have h₆ : 1 - Real.sqrt (1 + 2 * x) ≠ 0 := by
    intro h
    apply h₁
    nlinarith
  have h₇ : 4 * x ^ 2 / (1 - Real.sqrt (1 + 2 * x)) ^ 2 = (1 + Real.sqrt (1 +
    2 * x)) ^ 2 := by
    field_simp [h₆]
    nlinarith [sq_sqrt (show 0 ≤ 1 + 2 * x by linarith)]
  rw [h₇] at h₅
  constructor <=> nlinarith [sq_sqrt (show 0 ≤ 1 + 2 * x by linarith)]
```

Figure 2: Generated International Math Olympiad solution in Lean (DeepSeek Prover-1.5B, Xin et al 2024)

Why talk about Lean?

- Increasing interest from the mathematical community
- Increasing interest from the AI community
- For AI research, the choice of proof assistant matters (**not ideal!**)

3 open problems in neural theorem proving in Lean:

- Going beyond human data
- Going beyond competition problems
- Going beyond mathematics

1. Going beyond human data

Language model-based proving:

- **Train** a model $p_{\theta}(y|x)$ on a dataset $\mathcal{D} = \{(x, y)\}$, e.g.,
 - x : proof state
 - y : next tactic (next “step”)
 - \mathcal{D} : extracted from human-written theorems and proofs

1. Going beyond human data

Language model-based proving:

- **Train** a model $p_{\theta}(y|x)$ on a dataset $\mathcal{D} = \{(x, y)\}$, e.g.,
 - x : proof state
 - y : next tactic (next “step”)
 - \mathcal{D} : extracted from human-written theorems and proofs
- **Generate** proofs:

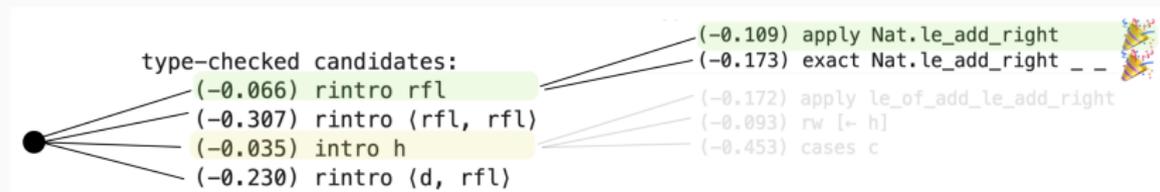

Figure 3: Best-first search

1. Going beyond human data

- Some models are already trained on \approx all Lean projects!
 - E.g., Lean-GitHub [5]: data from 237 Lean 4 repos
- More human-written data will help, but difficult to scale¹

¹Please don't stop making more publicly available formal mathematics data!

1. Going beyond human data

Open problem I: how do we *synthesize* useful data?

- Proofs
- Theorems
- Augmentations (formal, informal, ...)
- ...

1. Going beyond human data

Not a new problem; common methods:

- Statement autoformalization [Wu et al 2022 [4]]
 - Informal theorem \rightarrow formal theorem
- Expert iteration [Polu et al 2022 [3]]
 - Generate proofs with a model, train on successful ones, iterate

1. Going beyond human data

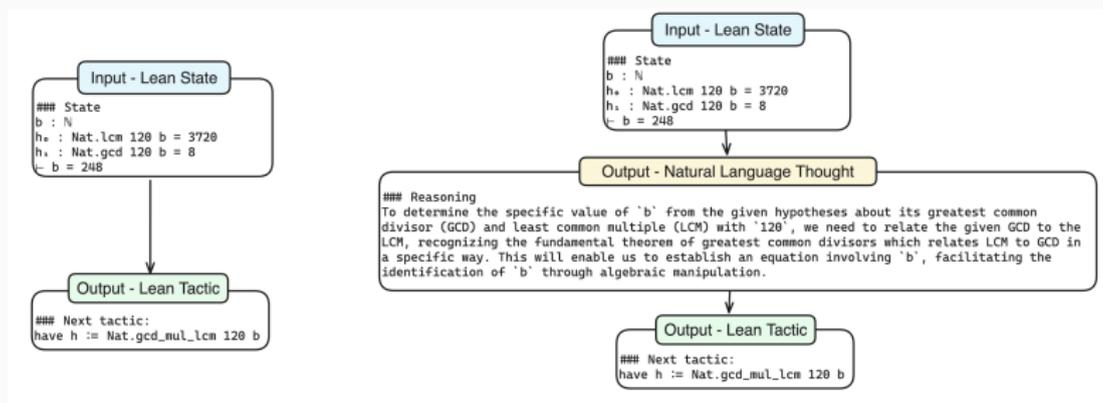

Not a new problem; common methods:

- Statement autoformalization [Wu et al 2022 [4]]
 - Informal theorem \rightarrow formal theorem
- Expert iteration [Polu et al 2022 [3]]
 - Generate proofs with a model, train on successful ones, iterate

Used in several state-of-the-art methods, e.g. DeepSeek-Prover 1.5, AlphaProof

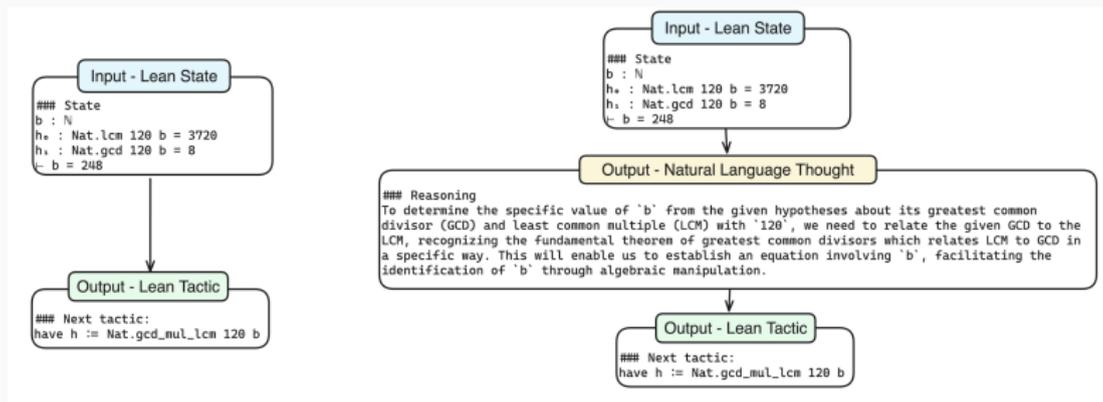

Lean-STaR: Learning to Interleave Thinking and Proving
Haohan Lin, Zhiqing Sun, Yiming Yang, Sean Welleck
<https://arxiv.org/abs/2407.10040>

1. Going beyond human data | Lean-STaR

Can we do better by interleaving *informal* steps of reasoning? (right)

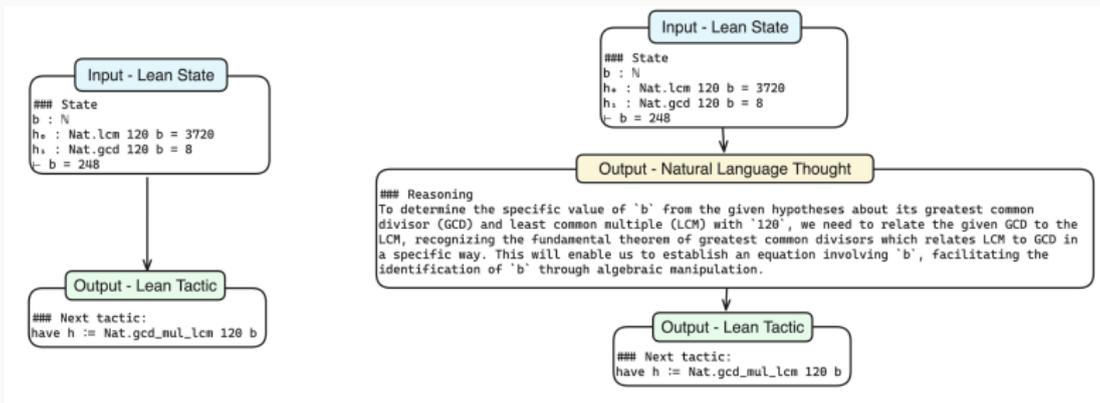

1. Going beyond human data | Lean-STaR

Why?

- Plan proof steps
- Diversify search space
- More tokens can give more computational capacity

1. Going beyond human data | Lean-STaR

Why?

- Plan proof steps
- Diversify search space
- More tokens can give more computational capacity

Data doesn't exist! We need to synthesize it.

1. Going beyond human data | Lean-STaR

Lean-STaR (Self-taught reasoner²)

Step 1: generate an informal “thought” with an off-the-shelf language model retrospectively

- (state, tactic) \rightarrow thought

Train an initial model on a dataset of such examples:

- $p_{\theta}^0(\text{thought}, \text{tactic} | \text{state})$

²Inspired by *STaR: Bootstrapping Reasoning with Reasoning*, Zelikman et al 2022

1. Going beyond human data | Lean-STaR

Step 2: generate proofs with the model

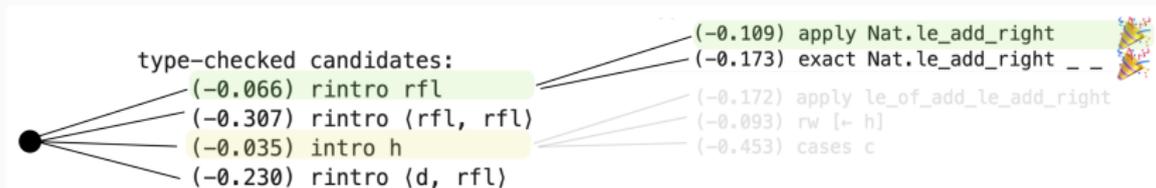

Figure 4: Best-first search: difficult to score (thought, tactic) candidates

1. Going beyond human data | Lean-STaR

Step 2: generate proofs with the model

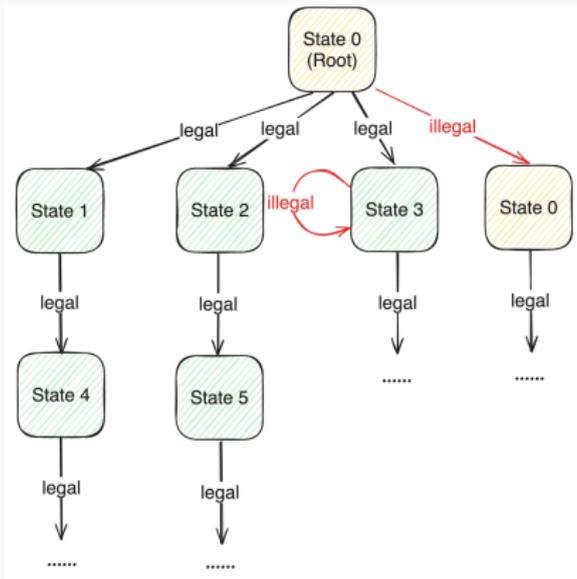

Figure 5: New sampling method

1. Going beyond human data | Lean-STaR

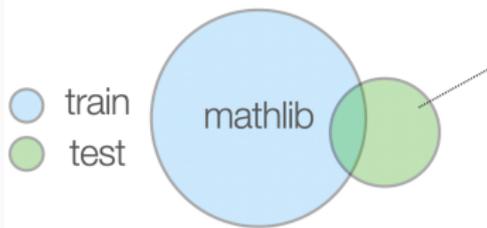

Step 3: train on the successful proofs, and repeat:³

- Collect (state, thought, tactic) from successful proofs
- Train a new model $p_{\theta}^1(\text{thought}, \text{tactic}|\text{state})$
- Generate proofs
- ...

³I.e. Expert Iteration [Polu et al 2022 [3]]

1. Going beyond human data | Lean-StaR

- miniF2F [7]: competition problems (AMC, AIME, IMO)

A Venn diagram with two overlapping circles. The left circle is light blue and labeled 'mathlib'. The right circle is light green. A legend to the left shows a blue circle labeled 'train' and a green circle labeled 'test'. An arrow points from the intersection of the two circles to the problem statement box.

Problem 1959 IMO Problems/Problem 1
Prove that the fraction $\frac{21n + 4}{14n + 3}$ is irreducible for every natural number n .

```
theorem imo_1959_p1
  (n : ℕ)
  (h₀ : 0 < n) :
  Nat.gcd (21*n + 4) (14*n + 3) = 1 := by sorry
```

1. Going beyond human data | Lean-STaR

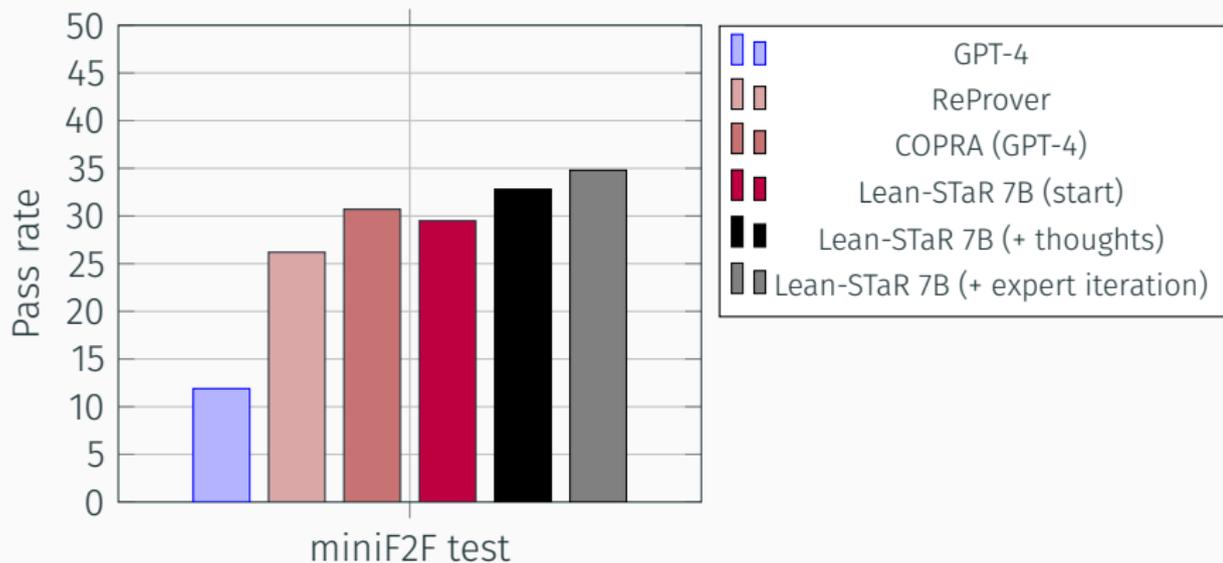

Figure 6: MiniF2F test

1. Going beyond human data | Lean-STaR

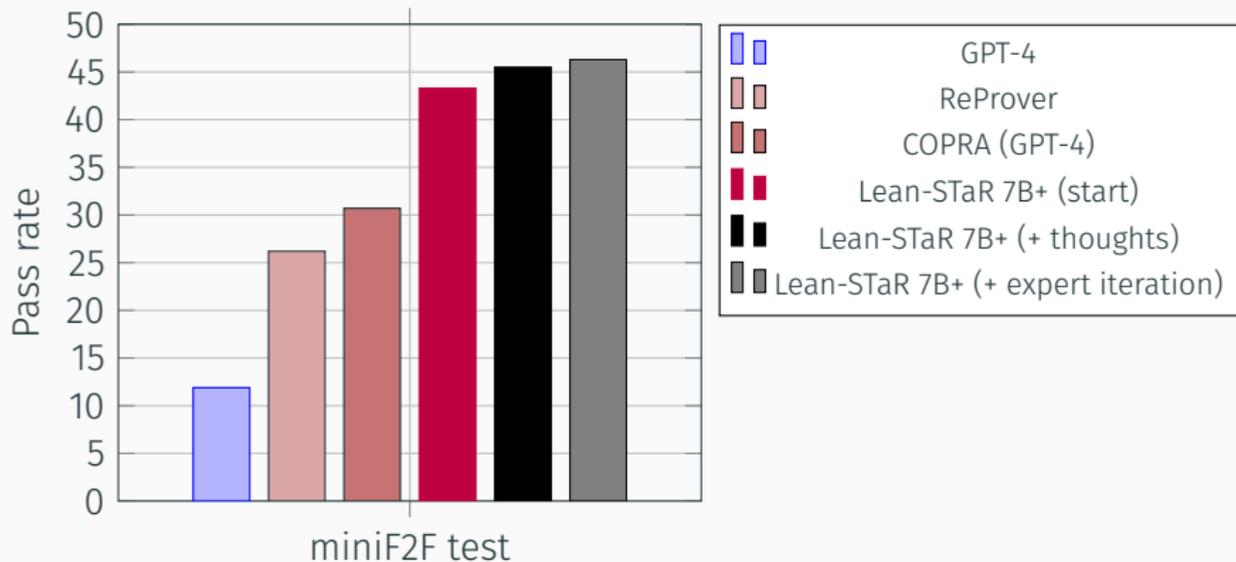

Figure 7: MiniF2F test

1. Going beyond human data | Lean-STaR

```
theorem amc12a_2002_p6 (n : ℕ) (h₀ : 0 < n)
  : ∃ m, m > n ∧ ∃ p, m * p ≤ m + p :=
  use n + 1, by linarith only [h₀] -- Reasoning: To demonstrate the existence of
  such an `m` and `p` that satisfy the given inequalities, we leverage the
  property of natural numbers that ensures an increase in `n` from `0` leads to
  the possibility of finding such `m` and `p`. This approach is supported by the
  fundamental property of natural numbers and their arithmetic operations,
  suggesting that for a given `n` greater than `0`, there exists a successor `m`
  and a number `p` that satisfy the conditions outlined.
  exact <0, by simp > -- Reasoning: To demonstrate that there exists an  $(n \in \mathbb{N})$ 
  such that  $((n + 1) * p \leq n + 1 + p)$  holds for some  $(p \in \mathbb{N})$ , we
  recognize that setting  $(p = 0)$  satisfies the inequality by the properties of
  zero in arithmetic. This is because  $(n + 1 > 0)$  by assumption, ensuring the
  left-hand side is non-negative and the right-hand side simplifies to  $(n + 1)$ ,
  making the inequality trivially true.
```

Figure 8: Example generated thoughts and proof from Lean-STaR

1. Going beyond human data Lean-STaR

```
theorem aime_1983_p2 (x p : ℝ) (f : ℝ → ℝ) (h₀ : 0 < p ∧ p < 15) (h₁ : p ≤ x ∧ x ≤ 15)
  (h₂ : f x = abs (x - p) + abs (x - 15) + abs (x - p - 15))
  : 15 ≤ f x :=
cases' h₁ with h₁ h₂ -- Reasoning: Given a function  $\lfloor f \rfloor$  defined over the real
numbers, where  $\lfloor f(x) \rfloor$  equals the sum of the absolute values of the
differences  $\lfloor (x - p) \rfloor$ ,  $\lfloor (x - 15) \rfloor$ , and  $\lfloor (x - p - 15) \rfloor$ , along with conditions
on  $\lfloor (p) \rfloor$  and  $\lfloor (x) \rfloor$  that ensure  $\lfloor (x) \rfloor$  lies between  $\lfloor (p) \rfloor$  and  $\lfloor (15) \rfloor$  and  $\lfloor (p) \rfloor$ 
is positive, we aim to show that  $\lfloor (f(x)) \rfloor \geq 15$ . To demonstrate this, we
consider all possible cases for the position of  $\lfloor (x) \rfloor$  relative to  $\lfloor (p) \rfloor$  and
 $\lfloor (15) \rfloor$ , specifically at  $\lfloor (p) \rfloor$  itself, between  $\lfloor (p) \rfloor$  and  $\lfloor (15) \rfloor$ , and at  $\lfloor (15) \rfloor$ .
By evaluating  $\lfloor (f(x)) \rfloor$  for each case, we can establish a lower bound of
 $\lfloor (f(x)) \rfloor$  that is greater than or equal to  $\lfloor (15) \rfloor$ .
simp (h₂, abs_of_nonneg (sub_nonneg.2 h₂), abs_of_nonneg (sub_nonneg.2 h₂), *)
-- Reasoning: The objective is to show that  $\lfloor (f(x)) \rfloor$  is at least 15 for  $\lfloor (x) \rfloor$ 
within the bounds  $\lfloor (p) \rfloor \leq x \leq 15$ , where  $\lfloor (p) \rfloor$  is positive but less than
15. The provided expression for  $\lfloor (f(x)) \rfloor$  suggests using properties of absolute
values and inequalities to simplify and analyze  $\lfloor (f(x)) \rfloor$ . By applying
simplification rules for absolute values and inequalities, along with the
given bounds, we aim to demonstrate the desired inequality  $\lfloor (f(x)) \rfloor \geq 15$ .
simp only [abs_of_nonneg] at * -- Reasoning: The objective is to establish an
inequality involving an expression with absolute values and a sum, where all
terms are functions of  $\lfloor (x) \rfloor$ . By recognizing that the absolute value functions
are always non-negative, we can simplify the given expression by removing the
absolute value symbols, thus focusing on the arithmetic manipulation of the
terms to demonstrate the inequality.
simp only [abs_of_nonneg, sub_add_eq_add_sub] at * -- Reasoning: The objective
is to demonstrate that the expression ' $15 \leq x - p + \lfloor (x - 15) \rfloor + \lfloor (x - p - 15) \rfloor$ '
holds given the conditions on ' $p$ ', ' $x$ ', and the function ' $f$ '. Since the
expression in question involves absolute values which inherently involve
non-negativity, manipulating these expressions to highlight their
non-negativity or equality is a logical initial step. This involves
recognizing that the absolute value of a difference can be rewritten as the
difference of absolute values, which simplifies the manipulation of the
expression to prove the inequality.
congr 1 -- Reasoning: To establish the inequality ' $15 \leq x - p + \lfloor (x - 15) \rfloor + \lfloor (x - p - 15) \rfloor$ ',
we recognize that the left-hand side of the inequality involves a
mix of additions and subtractions of real numbers. By introducing a congruence
transformation that simplifies operations involving absolute values, we aim to
align both sides of the inequality in a form that directly reflects the
properties of real numbers under these operations.
simp only [abs_of_nonpos (sub_nonpos.of_le h₂), abs_of_nonneg (sub_nonneg.of_le
h₁)] -- Reasoning: The objective is to prove an inequality involving absolute
values and subtractions that aligns the given conditions and constraints.
Simplification using the properties of absolute values and the provided bounds
can directly lead to the desired conclusion by expressing the absolute values
in terms of their underlying expressions and applying the given constraints.
simp [abs_of_pos, *] -- Reasoning: To prove the given inequality involving
absolute values, simplification using algebraic properties and given
hypotheses will directly lead us to the desired inequality by recognizing the
algebraic manipulation and application of the known bounds ' $h_1$ ' and ' $h_2$ ', as
well as the non-negativity of ' $p$ '.
rw [abs_of_nonpos] -- Reasoning: The objective is to demonstrate that ' $15 \leq 15 + \lfloor (x - p - 15) \rfloor - p$ '
under the given constraints on ' $p$ ' and ' $x$ '. Given ' $p < 15$ '
and ' $p \leq x \leq 15$ ', it's apparent that ' $p - 15$ ' is non-positive. This
observation allows us to apply the property that the absolute value of a
non-positive number is equal to its negative value, thereby simplifying the
expression on the right-hand side of the inequality.
all_goals linarith -- Reasoning: The goal involves demonstrating a relationship
between expressions involving inequalities and subtraction. The simplification
of these expressions into a form that directly compares their numerical values
can lead to a straightforward application of known inequalities and algebraic
properties, demonstrating the inequality's validity under the given conditions.
```

Figure 9: Example generated thoughts and proof from Lean-STaR

1. Going beyond human data | Lean-STaR

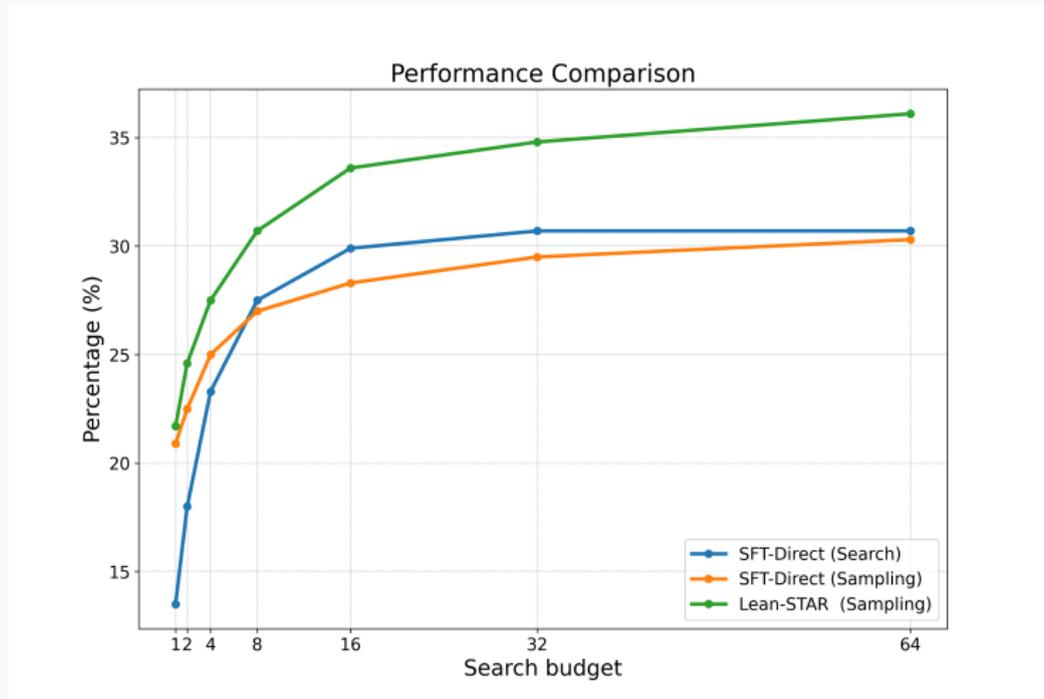

Figure 10: Increasing the search budget is more effective with thoughts

3 open problems in neural theorem proving in Lean:

- Going beyond human data
 - Synthesizing data: problems, proofs, plans, ...
- **Going beyond competition problems**
- Going beyond mathematics

2. Going beyond competition problems

Lots of exciting progress! Some methods can solve IMO problems!
However, not much impact on proving in practice.

2. Going beyond competition problems

Accessibility gap:

- Some methods are hard to integrate into tools
 - Not open-source (AlphaProof, ...)
 - Expensive to run (MCTS, ...)

2. Going beyond competition problems

Accessibility gap:

- Some methods are hard to integrate into tools
 - Not open-source (AlphaProof, ...)
 - Expensive to run (MCTS, ...)

However, there are model-agnostic tools available to plug into!

2. Going beyond competition problems

Code in a real repository

Figure 14: Interview questions \neq real code development

2. Going beyond competition problems

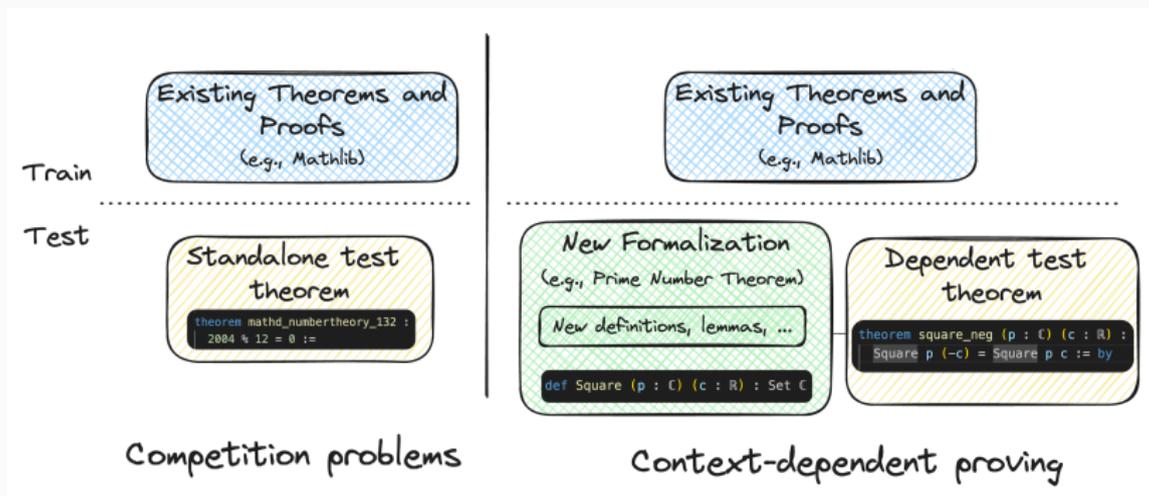

Figure 15: Competition problems \neq real proof development

2. Going beyond competition problems

Real-world proving is **context-dependent**:

- (context, theorem) \rightarrow proof
 - Context: repository of code, new definitions, auxiliary lemmas

2. Going beyond competition problems

Generalization to new contexts is studied in other proof assistants, e.g., online setting⁴, testing on held-out repositories⁵

Not a focus for state-of-the-art models/benchmarks in Lean!

⁴Tactician [2], Graph2Tac [1]

⁵CoqGym [6]

Lean Into Verified Software Development

by Keshia Hietala and Emina Torlak | on 08 APR 2024 | in [Amazon Verified Permissions](#), [Open Source](#), [Security](#), [Identity](#), & [Compliance](#), [Technical How-to](#) | [Permalink](#) | [Comments](#) | [Share](#)

Some software components are really important to get right, like your application's [access control policies](#) and core business logic. There are a growing number of tools that support [automated reasoning](#). In development, a [proof assistant](#) is a great tool for

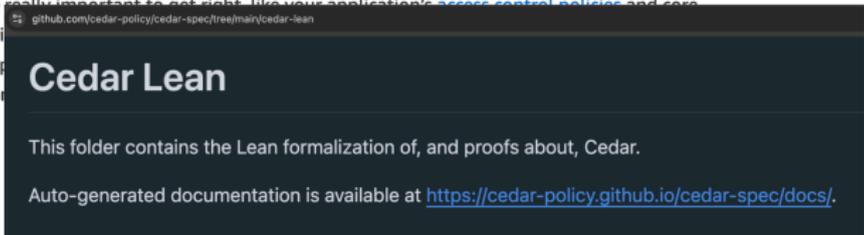

Figure 18: <https://aws.amazon.com/blogs/opensource/lean-into-verified-software-development/>

3. Going beyond mathematics

AI/neural theorem proving for program verification is actively studied in other proof assistants, such as Coq and Isabelle.

Not in Lean!

3. Going beyond mathematics

Our question:

- What is the simplest program verification scenario that:
 - Is a subproblem of the full 'verification problem'
 - Breaks current neural theorem proving methods

3. Going beyond mathematics

Our question:

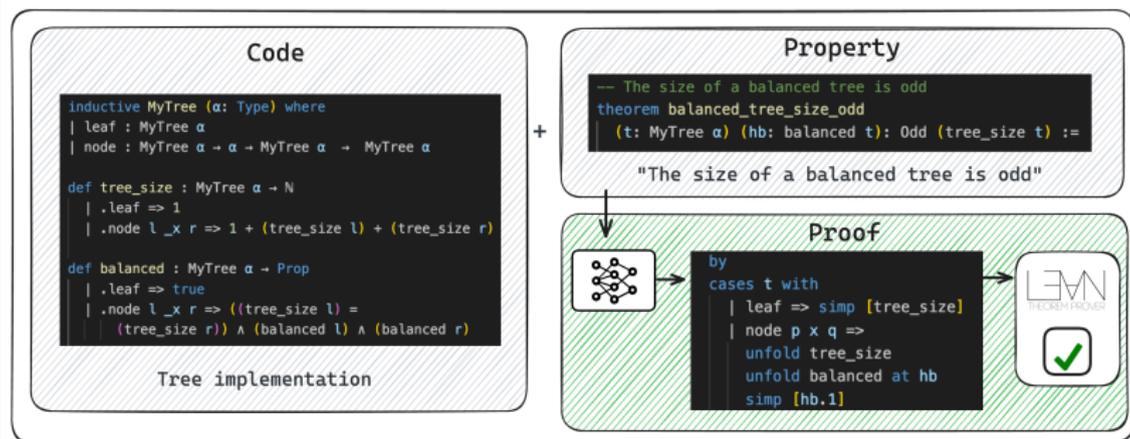

- What is the simplest program verification scenario that:
 - Is a subproblem of the full 'verification problem'
 - Breaks current neural theorem proving methods

"Simple":

- Self-contained, no complex dependencies
- Relatively small (fast, cheap evaluation)

3. Going beyond mathematics

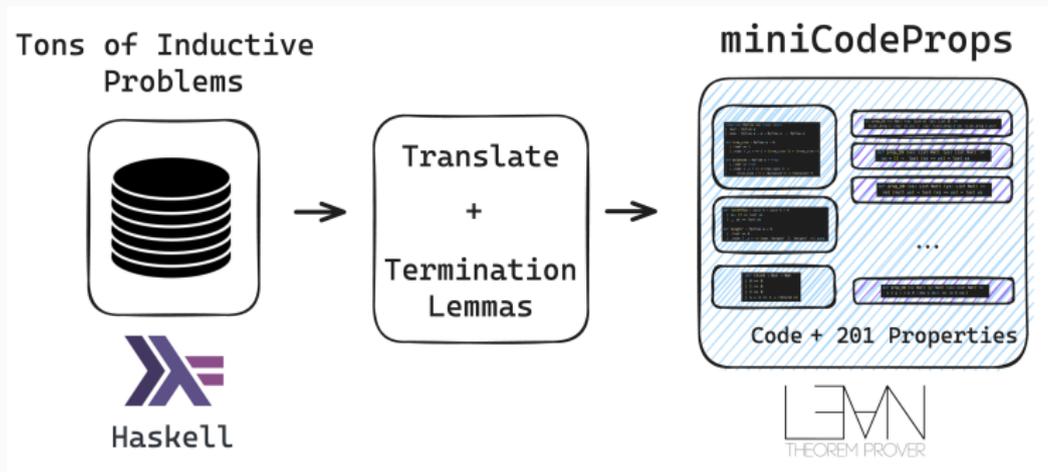

Formally verified code

Subproblem: theorem proving! Given (code, property), generate proof

3. Going beyond mathematics | miniCodeProps

Code blocks and 201 properties from *Tons of Inductive Problems*⁷, translated from Haskell to Lean.

⁷<https://tip-org.github.io/>, Claessen et al 2015

MiniCodeProps

- Implementation + properties about lists, trees, and heaps
- Classified into difficulties:
 - Easy: Data structure properties
 - Medium: Termination properties
 - Hard: Sorting algorithm properties

3. Going beyond mathematics | miniCodeProps

Evaluation:

- Given property and all dependent code, generate a proof

Models:

- **GPT-4o**: generate full proof, 32 attempts + 1 round of refinement
- **ntp-ctx**: generate a proof via best-first search

<https://github.com/cmu-l3/minicodeprops-eval>

3. Going beyond mathematics | miniCodeProps

Model	Easy	Medium & Hard	Overall
GPT-4o (32 samples)	75.6% (65/86)	4.34% (5/115)	34.8% (70/201)
+ refinement	77.9% (67/86)	6.96% (8/115)	37.3% (75/201)
ntp-context-1.3B	72.1% (62/86)	8.69% (10/115)	35.8% (72/201)

Figure 19: Baselines perform well on easy properties

3. Going beyond mathematics | miniCodeProps

Model	Easy	Medium & Hard	Overall
GPT-4o (32 samples)	75.6% (65/86)	4.34% (5/115)	34.8% (70/201)
+ refinement	77.9% (67/86)	6.96% (8/115)	37.3% (75/201)
ntp-context-1.3B	72.1% (62/86)	8.69% (10/115)	35.8% (72/201)

```

Figure 23: Human-written proof showing potential length of proofs

3 open problems in neural theorem proving in Lean:

- Going beyond human data
 - Synthesizing data: problems, proofs, plans, ...
- Going beyond competition problems
 - Have actual tools as a goal
- Going beyond mathematics
 - Program verification
